Carbon Border Adjustment Mechanism CBAM

Peppers Cable Glands Ltd designs, manufactures and supplies industrial and hazardous area cable glands, thread adaptors, stopping plugs and associated accessories to British and International Standards.

The Carbon Border Adjustment Mechanism (CBAM) is an environmental policy instrument designed to support the EU climate ambitions of achieving a net reduction of greenhouse gas (GHG) emissions of at least 55% by 2030 and of reaching climate neutrality by 2050 at the latest. The CBAM will apply the same carbon price to imported goods as would be paid by installations operating in the European Union (EU). In doing so, the CBAM reduces the risk of the EU's climate objectives being undermined by production relocating to countries with less ambitious decarbonisation policies (so-called 'carbon leakage') and introduces a strong signal to producers in third countries to decarbonise. The Implementing Regulation on reporting requirements and methodology provides for flexibility when it comes to the values used to calculate embedded emissions on imports during the transitional phase.

Peppers makes the following declaration in regard to the materials used in its products which are currently excluded from the scope of the policy instrument. Therefore we are not required to complete any request for information

Peppers Cable Glands Ltd, declares that, except where otherwise clearly indicated, these products are of UK preferential origin and are subjected to the Tariff Code 8536 90 10

This covers: Connections and contact elements for wire and cables.

For and on behalf of Peppers Cable Glands Ltd.
